PRELIMINARY AMENDMENT

Hon. Commissioner of Patents and Trademarks
United States Patent and Trademark office
Washington, D.C. 20231

Dear Sir:

In the above-identified application for United States
patent, please amend as follows:

IN THE TITLE

Change "ALUMINIUM" to read --ALUMINUM--.

IN THE ABSTRACT

lines 2 and 7, change "scabbing" to read --dross-forming--.

IN THE SPECIFICATION

Page 1

lines 4, 12 and 29, change "scabbing" to read
--dross-forming--;

lines 15, 23 and 26, change "scab" to read --dross--; and

line 34, change "scabs" to read --drosses--.

Page 2

lines 3, 25 and 26, change "scabbing" to read
--dross-forming--; and

line 12, change "scab-reducing" to read --dross-reducing--.

Page 3

line 24, change "scab" to read --dross--; and
lines 25, 31 and 34, change "scabbing" to read
--dross-forming--.

Page 4

Table 2, column 4, change "Scabbing" to read
--Dross-Forming--; and
last line, change "scabbed" to read --drossed--.

IN THE CLAIMS

Cancel claims 1-6, all the claims in the case, and
substitute the following claims therefor.

7. Process which comprises reducing the susceptibility to
dross-forming of an aluminum alloy melt with a content of at
least 2.5 wt.% magnesium, including adding to the melt from 0.02
to 0.15 wt.% vanadium and less than 60 ppm beryllium.

8. Process according to claim 7, including adding to the melt from 0.02 to 0.08 wt.% vanadium.

9. Process according to claim 8, wherein from 0.02 to 0.05 wt.% vanadium is added to the melt.

10. Process according to claim 7, wherein the melt includes a content of more than 3.5 wt.% magnesium, and including adding 25 to 50 ppm beryllium to the melt.

11. Process according to claim 10, including adding 25 to 35 ppm beryllium to the melt.

12. Process according to claim 7, wherein the melt includes a content of less than 3.5 wt.% magnesium, and including adding less than 25 ppm beryllium to the melt.

13. Process according to claim 7, for the production of casting alloys with

2.5 to 7 wt.% magnesium

max 2.5 wt.% silicon

max 1.6 wt.% manganese

max 0.2 wt.% titanium

max 0.3 wt.% iron

max 0.2 wt.% cobalt

less than 60 ppm beryllium

0.02 to 0.15 wt.% vanadium

and aluminum as the remainder and production-induced contaminants individually max 0.05 wt.% and total max 0.15 wt.%.

14. Process according to claim 13, for the production of diecasting alloys.

R E M A R K S

In accordance with the instant Preliminary Amendment, original claims 1-6 have been canceled and new claims 7-14 substituted therefor in better U.S. format.

The title and specification have been amended to make straight-forward spelling and grammatical changes.

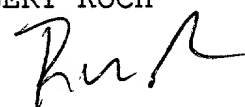

The English language translation of the originally filed application contained translation errors which have been corrected by this Preliminary Amendment. Thus, the translated terms "scabbing" and "scab" are not correct and should have been translated as "dross-forming" and "dross", respectively. These changes have been made in this Preliminary Amendment.

If any fees are required in connection with this case, it is respectfully requested that they be charged to Deposit Account No. 02-0184.

Respectfully submitted,

HUBERT KOCH

Treatment of an Aluminium Alloy Melt

09/719900
JC01 Rec'd PST/PTO

The invention concerns a process to reduce the susceptibility to scabbing of an aluminium alloy melt with a content of at least 2.5 w.% magnesium.

On an interruption to work in a foundry, for example over holidays or a weekend, a metal melt ready for casting can be held for more than 50 hours at a melt temperature of 750°C for example. After a long standing time, aluminium magnesium alloys with a high magnesium content have a tendency to scabbing. The presence of magnesium in the melt causes the protective oxide skin, which normally prevents oxidation of the aluminium, to become permeable and the aluminium can react with oxygen. On the melt forms a cauliflower-like scab which consists mainly of spinel ($MgO \cdot Al_2O_3$). This process is reinforced further in the cover heating furnace as the surface temperature of the metal bath, due to the radiant heat of the heating rods in the cover, is very high and convection in the metal bath is prevented by temperature layering. Because of the segregation due to gravitational force, magnesium becomes enriched close to the melt surface and leads to further reinforcement of this effect. The scab forming is very hard, has a cauliflower-like morphology and falls to the base of the crucible so that the entire furnace can be contaminated if the scab is not removed early enough. Scabbing commences earlier the higher the melt temperature.

It is known that the scabbing of aluminium magnesium alloys can be reduced but not totally avoided by the addition of beryllium. It has been observed that the beryllium content of an aluminium magnesium alloy in the melt diminishes with time and evidently, when the beryllium concentration falls below a critical level, scabs rapidly begin to form on the melt. An increased addition of beryllium to the metal melt is undesirable because of the carcinogenic properties of beryllium and should therefore be avoided as far as possible.

The invention is therefore based on the task of using alloy technology measures to lead to a higher scabbing resistance for aluminium magnesium alloys than is possible with an addition of beryllium according to the state of the art.

The task is solved according to the invention in that to the melt is added 0.02 to 0.15 w.% vanadium and less than 60 ppm beryllium.

10

Surprisingly it has been found that by the addition of vanadium, the scab-reducing addition of beryllium can take place in a substantially lower quantity than without the vanadium addition, where in general the addition of vanadium in a quantity of less than 0.05 w.% is sufficient even in alloys with a content of more than 5 w.% magnesium.

Preferably 0.02 to 0.08 w.% vanadium, in particular 0.02 to 0.05 w.% vanadium, is added to the melt.

20

For a content of more than 3.5 w.% magnesium, the addition of 25 to 50 ppm beryllium is sufficient, preferably 25 to 35 ppm beryllium. If the content of magnesium in the melt is less than 3.5 w.%, less than 25 ppm beryllium is required to achieve a high scabbing resistance. For lower requirements for the scabbing tendency, the beryllium addition can even be omitted completely.

A preferred use of the process according to the invention lies in the production of casting alloys with

2.5 to 7 w.% magnesium

max 2.5 w.% silicon

max 1.6 w.% manganese

max 0.2 w.% titanium

35 max 0.3 w.% iron

max 0.2 w.% cobalt

less than 60 ppm beryllium

0.02 to 0.15 w.% vanadium

and aluminium as the remainder and production-induced contaminants individually max 0.05 w.% and total max 0.15 w.%.

- 5 The process according to the invention is particularly preferred for use in production of diecasting alloys.

Further advantages, features and details of the invention arise from the description of exemplary embodiments below.

10

Approximately 50 kg of a magnesium aluminium alloy with different beryllium and vanadium content in each case were melted in a crucible in the induction furnace. The crucible was then transferred to a resistance furnace and there held
15 at a temperature of 750°C. The chemical analysis (in w.%) of the batches tested are summarised in table 1. Batches 1, 3 and 4 have a vanadium content according to the invention, batch 2 has a vanadium content lying outside the range according to the invention.

20

At specific time intervals, samples were taken from the different batches to determine the chemical composition. The melt surface was also observed at specific time intervals in order to determine the time of increased scab formation.
25 Table 2 shows the time up to scabbing of the melt as a function of the beryllium and vanadium content of the alloy. The results suggest that at least in the tested aluminium magnesium alloys with a high magnesium content, a low quantity of beryllium need be present in the melt in
30 addition to the proportion of vanadium according to the invention in order to achieve a high resistance to scabbing. Secondly, with the addition of vanadium in the range according to the invention, a beryllium content of around 25 ppm is sufficient to increase substantially the scabbing
35 resistance.

CLAIMS

1. Process to reduce the susceptibility to scabbing of an aluminium alloy melt with a content of at least 2.5 w.% magnesium,
characterised in that
to the melt is added 0.02 to 0.15 w.% vanadium and less than 60 ppm beryllium.
2. Process according to claim 1, characterised in that to the melt is added 0.02 to 0.08 w.% vanadium, preferably 0.02 to 0.05 w.% vanadium.
3. Process according to claim 1 or 2, characterised in that to the melt with a content of more than 3.5 w.% magnesium is added 25 to 50 ppm beryllium, preferably 25 to 35 ppm beryllium.
4. Process according to claim 1 or 2, characterised in that to the melt with a content of less than 3.5 w.% magnesium is added less than 25 ppm beryllium.
5. Use of the process according to any of claims 1 to 4 for production of casting alloys with
2.5 to 7 w.% magnesium
max 2.5 w.% silicon
max 1.6 w.% manganese
max 0.2 w.% titanium
max 0.3 w.% iron
max 0.2 w.% cobalt
less than 60 ppm beryllium
0.02 to 0.15 w.% vanadium
and aluminium as the remainder and production-induced contaminants individually max 0.05 w.% and total max 0.15 w.%.
6. Use of the process according to claim 5 to produce diecasting alloys.

ABSTRACT

In a process to reduce the susceptibility to scabbing of an aluminium alloy melt with a content of at least 2.5 w.% magnesium, to the melt is added 0.02 to 0.15 w.% vanadium and less than 60 ppm beryllium. By the addition of vanadium, the beryllium addition can be reduced and at the same time the scabbing resistance of the melt increased.

CLAIM FOR BENEFIT OF EARLIER US/PCT APPLICATION(S)
UNDER 35 U.S.C. § 120

- ☐ The claim for the benefit of any such applications are set forth in the attached ADDED PAGES TO COMBINED DECLARATION AND POWER OF ATTORNEY FOR DIVISIONAL, CONTINUATION OR CONTINUATION-IN-PART (C-I-P) APPLICATION.

(Declaration and Power of Attorney [1-1]—page 4 of 7)

**ALL FOREIGN APPLICATION(S), IF ANY, FILED MORE THAN 12 MONTHS
(6 MONTHS FOR DESIGN) PRIOR TO THIS U.S. APPLICATION**

NOTE: If the application filed more than 12 months from the filing date of this application is a PCT filing forming the basis for this application entering the United States as (1) the national stage, or (2) a continuation, divisional, or continuation-in-part, then also complete ADDED PAGES TO COMBINED DECLARATION AND POWER OF ATTORNEY FOR DIVISIONAL, CONTINUATION OR C-I-P APPLICATION for benefit of the prior U.S. or PCT application(s) under 35 U.S.C. § 120.

POWER OF ATTORNEY

I hereby appoint the following practitioner(s) to prosecute this application and transact all business in the Patent and Trademark Office connected therewith.

(list name and registration number)

Robert H. Bachman (19,374), Gregory P. LaPointe (28,395),
Barry L. Kelmachter (29,999) and George A. Coury (34,309)

(check the following item, if applicable)

- ☐ I hereby appoint the practitioner(s) associated with the Customer Number provided below to prosecute this application and to transact all business in the Patent and Trademark Office connected therewith.
- ☐ Attached, as part of this declaration and power of attorney, is the authorization of the above-named practitioner(s) to accept and follow instructions from my representative(s).

NOTE: "Special care should be taken in continuation or divisional applications to ensure that any change of correspondence address in a prior application is reflected in the continuation or divisional application. For example, where a copy of the oath or declaration from the prior application is submitted for a continuation or divisional application filed under 37 CFR 1.53(b) and the copy of the oath or declaration from the prior application designates an old correspondence address, the Office may not recognize, in the continuation or divisional application, the change of correspondence address made during the prosecution of the prior application. Applicant is required to identify the change of correspondence address in the continuation or divisional application to ensure that communications from the Office are mailed to the current correspondence address. 37 CFR 1.63(d)(4)." § 601.03, M.P.E.P., 7th Edition.

☐ Customer Number _____

(complete the following if applicable)

Since this filing is a ☐ continuation ☐ divisional there is attached hereto a Change of Correspondence Address so that there will be no question as to where the PTO should direct all correspondence.

DECLARATION

I hereby declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code, and that such willful false statements may jeopardize the validity of the application or any patent issued thereon.

SIGNATURE(S)

NOTE: Carefully indicate the family (or last) name, as it should appear on the filing receipt and all other documents.

NOTE: Each inventor must be identified by full name, including the family name, and at least one given name without abbreviation together with any other given name or initial, and by his/her residence, post office address and country of citizenship. 37 CFR § 1.63(a)(3).

NOTE: Inventors may execute separate declarations/oaths provided each declaration/oath sets forth all the inventors. Section 1.63(a)(3) requires that a declaration/oath, inter alia, identify each inventor and prohibits the execution of separate declarations/oaths which each sets forth only the name of the executing inventor. 62 Fed. Reg. 53,131, 53,142, October 10, 1997,
